of zonulin

```
CC (2), one of 25 such peptides (see Y3)105-29) of the invention, which bind to a zonula occludents toxin (20T) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (173). The peptide antagonists are based on a common motif of 20T and human zonulins, which is believed to be critical for receptor of the invention of the property of the common motif of 20T and human zonulins, which is believed to be critical for receptor of the intestine of the inflammation, where they bind to the 20T receptor in the intestine of intestine of the intestine of the intestine of intestine of the intestine of the intestine of the intestine of intestine of the intestine of intestine of the intestine of intestine of intestine intestinal inflammation the peptide is useful for treating intestinal conditions that cause protein losing enteropathy of consessed intestinal conditions that cause protein losing enteropathy of caused by infection, e.g. Clostridum difficile infection, consessed intestinal conditions, e.g. gastrict infection, consessed intestinal conditions, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases with mucosal disease without unceration, e.g. mesenteric tuberculosis, und after surgical correction of congenital heart disease with Fontan's operation, collagenous colours and the period in the surgical correction of congenital heart disease with Fontan's operation, collageness without unceration, e.g. menetrier's diseases, e.g. collagenes, eosinophilic gastroenteritis, and immune diseases, collageness existement of conditions of congenital heart disease with Fontan's operation, collageness withematosus or food allergies, primarily to collage diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

CC (TJ). The peptide antagonists are based on a common motif of 207 CC and human zonulins, which is believed to be critical for receptor CC binding. They can be prepared by chemical synthesis or by use of CC recombinant DNA techniques. The peptide antagonists are used as an CC antiinflammation, where they bind to the ZOT receptor in the intestinal CC inflammation, where they bind to the ZOT receptor in the intestinal CC inflammation, where they bind to the ZOT receptor in the intestinal CC inflammation conditions give rise to CC increased intestinal permeability modulate the opening of TJ in the CC increased intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, e.g. clostridium difficile infection, e.g. clostridium difficile infection, e.g. congenitations that cause protein losing enteropathy concerning colitis, shigellosis, viral gastroenteritis, parasite with CC mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, CC collagenous colitis, inflammatory bowel disease, diseases with CC sarcoidosis lymphoma, mesenteric tubercolosis, and after surgical CC correction of congenital heart disease with Fontan's operation, CC mucosal disease without ulceration, e.g. Menetrier's disease, cellia, systemic lupus erythematosus or food allergies, primarily to CC milk.
                                                                                                                                                                                                                                                                                    Query Match

The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammatton, where they bind to the ZOT receptor in the intestine and yet does not physiologically modules.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection,
                                                         Zonulin; antagonist;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see y79105-29) of the invention, which bind to a zonula occludent toxin (207) receptor, yet do not compliant to a zonula occludent toxin (207) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (T). The peptide antagonists are based on a common motif of 207 cand human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antinifiammation, where they bind to the 207 receptor in the intestinal inflammation where they bind to the 207 receptor in the intestinal candidate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to intestine. Gastrointestinal inflammation conditions give rise to concased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection.

Caused by infection, e.g. Clostridium difficile infection, caused by infection, e.g. congenitan spatrality, parasite collagenous colitis, inflammatory bowel disease, diseases with collagenous colitis, inflammatory bowel disease, diseases with collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, collagenous colitis, inflammatory bowel disease, diseases marked by lymphonic best of congenital heart disease with Fontan's operation, collagenous colitis, inflammatory bowel disease, diseases, diseases, cosinophilic gastroonteritis, and immune diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                    This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y9105-29) of the invention. CC which bind to a zonula occludens toxin (207) receptor, yet do not compliant to the control of the invention. CC physiologically modulate the opening of mammalian tight junctions CC (TJ). The peptide antagonists are based on a common motif of 207 and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammation, where they bind to the ZOT receptor in the intestinal inflammation where they bind to the ZOT receptor in the intestinal conditions that cause poeting of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating infestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, caused by infection, e.g. Clostridium difficile infection, cancer, diseases with collapse of the collists, inflammatory bowel disease, diseases with collists, inflammatory bowel disease, diseases with collists obstruction, e.g. congenital intestinal lymphangiectasia, correction of congenital heart disease with Fontan's operation, colliscase, esinophilic gastroenterits, and immune diseases, celiac disease, esinophilic gastroenterits, and immune diseases, celiac disease, esinophilic gastroenterits, and immune diseases, celiac disease, esinophilic gastroenterits, and immune diseases, celiac celiac disease, esinophilic gastroenterits, and immune diseases.
                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Zonulin; antagonist; zonula occludens toxin receptor; blood brain barrier; antiinflammatory; cerebroprotective; neuroprotective; dermatological; antiulcer; antiviral; antibacterial; cytostatic; anti-HIV; vulnerary; antiallergic; hypotensive; immunosuppressive; antiparasitic; vasotropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New peptide antagonist of zonulin useful as antiinflammatory agent treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2000-205565/18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           03-AUG-1998;

Guanylin is an intestinal guanylate cyclase regulator which has similarity to bacterial heat exists enterotoxins which activate intestinal guanylate cyclases. The guanylate can be used as a laxative in the treatment of constipation.

The present invention describes a recombinant fibre protein (I) comprising an amino terminus of an adenoviral fibre protein and a CC trimerisation domain. The trimerisation domain comprises: (a) an adenoviral fibre knob domain having a mutation affecting at least one amino acid residue within the region corresponding to the AB loop.

CB sheet, DE loop or FG loop of the wild-type adenoviral fibre knob domain produced in a eukaryotic cell; or (b) an adenoviral fibre knob domain produced in a eukaryotic cell; or (b) an adenoviral fibre knob domain corresponding to residue positions 404-405, 408, 409, 412-417, 420, 439, 441, 442, 443-443, 458, 460, 462, 466, 469, 409, 417-417, 482, 485, 461, 442, 443-443, 458, 460, 462, 466, 469, 409, 417-417, 482, 485, 481, 442, 443-443, 458, 460, 462, 465, 469-472, 474-477, 482, 485, 487-492, 505-512, 515, 517, 519, 521-528, 533, 535, 537-549, 551, 559, 569, 569 or 581 of the wild-type Ad5 fibre protein, and where the recombinant fibre protein trimerises when produced in a eukaryotic cell, (I) are used for creating vectors when are useful in avariety of sene-transfer applications, in vitro and in vivo, for delivering a desired gene to a cell with minimal ectopic infection. Particularly, the vectors are useful for infecting a desired cell type, an approach known as alternative targeting. (I) can be used in receptor-ligand construction of safer vectors for gene transfer application; The present sequence, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC v68642-70 represent the amino acid sequences of the fiber proteins CC of Adenovirus serotypes 8, 9, 13, 14, 20, 23, 24, 25, 27, 28, 29, 30, CC 32, 33, 34, 35, 36, 37, 38, 39, 42, 43, 44, 45, 46, 47, 48, 49 and 51. CC The proteins are used in the course of the invention to construct CC chimaeric adenoviruses with reduced antigenicity. The chimaeric CC adenoviruses comprise at least part of a fiber protein of an adenovirus serotype providing the chimaeric virus with a desired host range and at CC least part of a penton or hexon protein from another, less antigenic, CC serotype. The chimaeric adenoviruses are useful for gene therapy, CC especially where repeated delivery is required. Adenoviruses of the CC invention are useful can be constructed to have a desired host range and CC adminished capability to raise neutralizing antibodies, an absence of, CC or decreased infection of, antigen presenting cells of the immune system CC (e.g. macrophages), and an ability to escape trapping in the liver cc through increased target cell specificity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The proteins are used in the course of the invention to construct chimaeric adenoviruses with reduced antigenicity. The chimaeric adenoviruses comprise at least part of a fiber protein of an adenovirus serotype providing the chimaeric virus with a desired host range and at least part of a penton or hexon protein from another, less antigenic, serotype. The chimaeric adenoviruses are useful for gene therapy, especially where repeated delivery is required. Adenoviruses of the invention are useful can be constructed to have a desired host range and a diminished capability to raise neutralizing antibodies, an absence of, or decreased infection of, antigen presenting cells of the immune system (e.g. macrophages), and an ability to escape trapping in the liver
Y68642-70 represent the amino acid sequences of the fiber proteins of Adenovirus serotypes 8, 9, 13, 14, 20, 23, 24, 25, 27, 28, 29, 32, 33, 34, 35, 36, 37, 38, 39, 42, 43, 44, 45, 46, 47, 48, 49 and The proteins are used in the course of the invention to construct chimaeric adenoviruses with reduced antigenicity. The chimaeric adenoviruses at least part of a fiber protein of an adenov

The chimaeric adenoviruses are useful for gene therapy, invention are useful can be constructed. Adenoviruses of the adminished capability to raise neutralizing antibodies, an absence of, of e.g. macrophages), and an ability to escape trapping in the liwer through increased target cell specificity.

A05803 to A05872 encode proteins, polypeptides and peptides (given in Y91775 to Y91343) isolated from Group B Streptococcus (GBS), also known as Streptococcus agalactiae. The GBS polynucleotides and polypeptides have antibacterial activity. Immunogenic compositions comprising GBS polynucleotides or polypeptides can be used as vaccines and for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a secreted human protein encoded by the gene CC clone detailed in the descriptor line. The gene can be used to generate portion (e.g., x84924) for increasing the stability of the fene can be used to generate as compared to the human protein only.

CC as compared to the human protein only.

CC acid sequences: x84933-x88957; amino acid sequences x77567-x27933) which are useful for preventing, treating or ameliorating medical conditions are useful for preventing, treating or ameliorating medical conditions core by determining the amount of the new polypeptides in a sample which cuses are described for each of the 125 polynucleotides, based on uses, tissues they are most highly expressed in (see x84933 for described courses).
                                                                                                                                                  Claim 1; Fig 1; 123pp;

```
CC treatment or prophylaxis of GBS infection. The polynucleotides and CC polypeptides can also be used in the detection of GBS and for screening CC pNA encoding bacterial cell envelope associated or secreted antigens in CC gram positive bacteria. AOSB973 to AOSB941 represent primers used in the XX SQ Sequence 116 AA;

5-methyltetrahydropteroyltriglutamate--homocysteine S-methyltransferase (EC 2.1.1.14) -
N;Alternate names: cobalamin-independent methionine synthase
C;Species: Methanobacterium thermoautotrophicum
C;Date: 28-oct-1996 #sequence_revision 13-Mar-1997 #text_change 20-Jun-2000
C;Accession: S62191
R;Vaupel, M; Dietz, H; Linder, D; Thauer, R.K.
Eur. J. Blochem. 236, 294-300, 1996
A;Title: Primary structure of cyclohydrolase (Mch) from Methanobacterium thermoautotroph
A;Reference number: S62190; MUID:96184910
A;Accession: S62191
A;Status: preliminary; nucleic acid sequence not shown; translation not shown
A;Molecule type: DNA
A;Residues: 1-319 <VAU>
A;Cross-references: EMBL:X92082; NID:g1103706; PIDN:CAA63062.1; PID:g1103707
A;Note: the nucleotide sequence was submitted to the EMBL Data Library, October 1995
C;Genetics:
A;Start codon: TTG
C;Superfamily: 5-methyltetrahydropteroyltriglutamate--homocysteine S-methyltransferase
C;Keywords: methyltransferase
Search completed: June 13, 2001, 14:10:48 Job time: 149 sec

        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score

Petermination of the solution structure of the peptide hormone guanylin: observation of a novel form of topological strengthen.";

Blochemistry 33:13581-13592(1994).

1- FUNCTION: ENDOGENOUS ACTIVATOR OF INTESTINAL GUANYLATE CYCLASE.

IT STIMULATES THIS ENZYME THROUGH THE SAME RECEPTOR BINDING REGION AS THE HEAT-57ABLE ENTEROTOXINS.

1- SIMILARITY: BELONGS TO THE GUANYLIN FAMILY. ALSO SIMILAR TO HEAT-STABLE BYTEROTOXINS.
                                                                                                                                                                                                    FRANTS; PRO0774; GUANYLIN. Signal; 3D-structure. SIGNAL

Thauer R.K.;

Methylcobalamin:homocysteine methyltransferase from Methanobacterium thermoautotrophicum. Identification as the mete gene product.";

Eur. J. Biochem. 263:789-796(1999).

1- FUNCTION: CATALYZES THE TRANSFER OF A METHYL GROUP FROM METHYLCOBALAMIN AND METHYLCOBINAMIDE TO HOMOCYSTEINE RESULTING IN METHIONINE FORMATION.

1- COPACTOR: ZINC. BINDS ONE MOLE PER SUBUNIT (BY SIMILARITY).

1- PATHWAY: TERMINAL STEP IN THE DE NOVO BIOSYNTHESIS OF METHIONINE.

1- SUBUNIT: MONOMER.

1- SIMILARITY: BELONGS TO THE VITAMIN-B12 INDEPENDENT METHIONINE.

SYNTHASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         20

THE FOUR PROTEINS FIXA, FIXA AND FIXS MAY PARTICIPATE IN A MEMBRANE-BOUND COMPLEX COUPLING THE FIXI CATION PUMP WITH A REDOX PROCESS CATALYZED BY FIXG.

-!- CATALYTIC ACTIVITY: ATP + H(2)0 = ADP + ORTHOPHOSPHATE.

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-!- SIMILARITY: BELONGS TO THE CATION TRANSPORT ATPASES FAMILY (E1-E2 ATPASES). SUBFAMILY IB.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
